Message

From the Vice-Chancellor Desk

Welcome to the May edition of e-newsletter of Dr. Rajendra Prasad Central Agricultural University.

The month of May is hot and dry season for farmers with temperature rising from 40 to 44 degree Celsius this year. According to annual rainfall reports of IMD, Bihar has been witnessing deficiency of rainfall during monsoon. As per reports the state has recorded less than normal rainfall in last seven years and the underground water level is depleting at alarming stage. If current trends persist, 60 percent of India's districts and most districts of Bihar are likely to see groundwater tables fall to critical levels within few years because of which not only the agriculture shall be at risk but life of millions shall also be affected drastically.

While everyone is praying Monsoon to come soon, the paradox is that the rains will bring water logging in many cities. Conservation of surplus monsoon water for utilization during dry period is most imperative need of the time. The University has innovated low cost unique ground water recharge cum drainage system. Along with the members of the board of management I inaugurated this unit on 25th January 2019. This methodology is ideally suitable for rural and urban area as well. I visited Dhab area and was happy to see the Bamboo plantation and fodder crop grown on river bed land vacated by river post monsoon. My colleagues in the University are doing a wonderful job which you will witness when you will see the glimpses of various other important activities of the University held in May.

I hope you will enjoy reading.

Happy Reading!!!
